JavaScript Error Handling

This supports the next stage of your roadmap and addresses a concept you haven't mastered yet.

Learn now →

Need help deciding what to do next?

Ask mindpilot about your career, roadmap, or current learning task.

Open Guide

Accessibility & responsive intent

Design specifications only. No keyboard, touch, loading, or adaptive behavior is implemented.

Keyboard & labeled controls

Tab follows the visual reading order: navigation → header → next action → supporting content.

Enter activates buttons and links. Space toggles checkboxes; arrow keys move through radio options.

Focus uses a visible 2px black outline with an intended 2px offset. Keep focus distinct from selection.

Inputs keep visible labels. Errors include text. All status cues use an icon or explicit label.

Use dark ink on light semantic fills. Avoid accent-only small text where contrast is insufficient.

Responsive & touch

Desktop: persistent sidebar, header actions, compact three-stat row, next action first.

Mobile: stack Greeting → Next Step → Progress → Attention → Roadmap → Activity → Recommendation → Guide.

Use at least 44px action targets. No horizontal overflow; wrap metadata and long labels.

Mobile navigation: Home, Roadmap, Learn, Guide, Progress. Intended to remain at the viewport edge while content scrolls.

The full-height mobile frame shows the complete scroll content, with navigation at the end for review.

FULL-STACK DEVELOPMENT / ADVANCED JAVASCRIPT

async/await practice

apply the concept one question at a time. review the feedback after you finish.

What does await do inside an async function?

Choose the statement that best describes its behavior.

☐ A. It blocks the entire JavaScript runtime.

☒ B. It pauses the async function until the promise settles. Selected

☐ C. It converts every rejected promise into a resolved one.

☐ D. It makes the function return a plain value instead of a promise.

Answer selected. You can change it before moving to the next question.

full-stack development / advanced javascript

making sense of async/await

understand how asynchronous code flows before returning to practice.

concept lesson · 12 min read · sample content

write asynchronous code in a clear sequence

a promise represents work that may finish later. async/await lets you describe that work in a readable order without blocking the whole application.

1. mark the function as async

an async function always returns a promise. inside it, await pauses that function until a promise settles.

```
async function readLesson() {
  const lesson = await loadLesson();
  return lesson.title;
}
```

2. handle what could go wrong

use try/catch around awaited work when you need to handle a rejected promise. don't assume every asynchronous operation succeeds.

📌 remember: await pauses the async function, not the entire javascript runtime.

Continue to practice

Ask Guide about this

in this lesson

- ✓ promises recap
- **async functions & await**
- handling rejected promises
- check your understanding

current stage: advanced javascript

why this lesson?

your sample async/await result is 42%. review the concept, then practice using it.
